Applicant's arguments filed 06/16/2009 have been fully considered but they are not persuasive.

Applicant argues that A) Suzuki does not perform the step of "storing a plurality of independent sets of filter coefficients in memory, wherein each set of filter coefficients defines a different polyphase filter function...," as in claim 1; and B) Suzuki is not "selecting one of the sets of filter coefficients."

As to argument A) examiner respectfully disagrees. Suzuki as cited in the rejection teaches the stored sets of filter coefficients as recited in the claims. Furthermore, in Suzuki, column 3, lines 5-20 and column 8, lines 14-51 disclose linear phase characteristics of the coefficients employed for the input and output waveshapes. As such it is described that the linear phase characteristics provide "phases" of input and output waveshapes of a filter that result in an output waveshape free from distortion. This results in filtering digital tone signals for a plurality of phases. Thus, when given the broadest reasonable interpretation, this includes polyphase functions as well.

As to argument B) examine respectfully disagrees. When given the broadest reasonable interpretation the Suzuki reference teaches the claimed limitation. As recited in the rejection, (Suzuki, column 23, lines 31-51) Suzuki teaches sets of filter coefficients prepared for corresponding to several orders of key touch. Thus, there is a at least one set of coefficients to be selected for interpolation; and when given the broadest reasonable interpretation reads on the claimed limitation.
